

Give Your App a Voice

MiMo TTS & ASR — with your Vibe key

Text → Speech. Speech → Text.

Same API key you already use for chat.

What you get

- **TTS** (Text → Speech): type text, get an audio clip. Natural voices.
- **ASR** (Speech → Text): upload audio, get a transcript.
- **Same** **VIBE_KEY** as your chat / Claude Code key. Nothing new to install.
- Base URL: <https://proxy.vibecode.tours>

Powered by **Xiaomi MiMo v2.5** behind our proxy.

The two endpoints

Feature	Call	Model
Text → Speech	POST /v1/audio/speech	mimo-v2.5-tts
Speech → Text	POST /v1/audio/transcriptions	mimo-v2.5-asr

Auth on both — same as chat:

Authorization: Bearer \$VIBE_KEY

TTS in one curl

```
curl -X POST https://proxy.vibecode.tours/v1/audio/speech \  
-H "Authorization: Bearer $VIBE_KEY" \  
-H "Content-Type: application/json" \  
-d '{"model":"mimo-v2.5-tts","voice":"Chloe",  
  "response_format":"wav","input":"Hey boss — I passed!"}' \  
-o out.wav
```

Returns **raw** **.wav** **bytes** → write straight to a file. Then play **out.wav**.

TTS in Python

```
import requests, os
r = requests.post(
    "https://proxy.vibecode.tours/v1/audio/speech",
    headers={"Authorization": f"Bearer {os.environ['VIBE_KEY']}"},
    json={"model": "mimo-v2.5-tts", "voice": "Chloe",
         "response_format": "wav", "input": "Hey boss — I passed!"})
open("out.wav", "wb").write(r.content)
```

⚠ Use `requests` / `curl`, **not** the `openai` SDK for TTS — it rejects the voice name `"Chloe"` client-side (only allows OpenAI's own voices).

Voices (English)

Voice		Voice	
Chloe	female (default)	Milo	male
Mia	female	Dean	male

Just change `"voice": "..."` . Pick one that fits your app's character.

ASR in one curl

```
curl -X POST https://proxy.vibecode.tours/v1/audio/transcriptions \  
-H "Authorization: Bearer $VIBE_KEY" \  
-F "model=mimo-v2.5-asr" \  
-F "language=auto" \  
-F "file=@clip.wav"
```

Returns `{"text": "..."} . language = auto | en | zh .`

ASR in Python — SDK works here

```
from openai import OpenAI      # ASR IS Whisper-compatible
client = OpenAI(api_key=os.environ["VIBE_KEY"],
                base_url="https://proxy.vibecode.tours/v1")
with open("clip.wav", "rb") as f:
    print(client.audio.transcriptions.create(
        model="mimo-v2.5-asr", file=f).text)
```

Unlike TTS, the `openai` SDK works fine for ASR.

ASR file rules

- Keep a **real** `.wav` / `.mp3` **extension** — the server reads the type from the filename.
- Max ~**10 MB** per file.
- Short clips transcribe fast and clean (punctuation included).

Cost — please read

- **TTS = free** right now (MiMo limited-time promo). Could end anytime.
- **ASR = expensive** (~30M credits / hour of audio).

Rules of thumb:

- Use ASR on **short clips**. Don't loop it. Don't transcribe hours of audio.
- Treat it like a paid API — because it is.

Limits of the proxy shim

Through your Vibe key you get **basic** TTS (voice + text) and ASR (transcribe).

Advanced MiMo features need the **native** `chat/completions` audio format:

- 🎭 emotion / style prompts
- 🧬 voice cloning (from a sample)
- 🎨 voice design (from a description)
- 🎵 singing

Read the originals (MiMo docs)

- **TTS guide** — voices, styles, cloning, design:

mimo.mi.com/docs/en-US/quick-start/usage-guide/audio/speech-synthesis-v2.5

- **ASR guide** — languages, dialects, formats:

mimo.mi.com/docs/en-US/quick-start/usage-guide/audio/Speech-Recognition

- **Platform:** platform.xiaomimimo.com

Build ideas

- Read your app's results **out loud** (accessibility, hands-free).
- Voice **note** → **text** input instead of typing.
- A talking **onboarding / tutorial** for your demo video.
- Voiceover for your **YouTube upload**.

Go make noise

Demo scripts: `demo/` → `tts.sh` , `tts.py` , `asr.sh` , `asr.py` , `README.md`

```
export VIBE_KEY=sk-...  
./tts.sh "Our app just shipped."
```

Questions → your channel. Happy building.
